

# A *Swift* View of the Universe

Professor Lynn Cominsky  
Department of Physics and  
Astronomy  
Sonoma State University

# Gamma rays: $E > 10^6$ eV

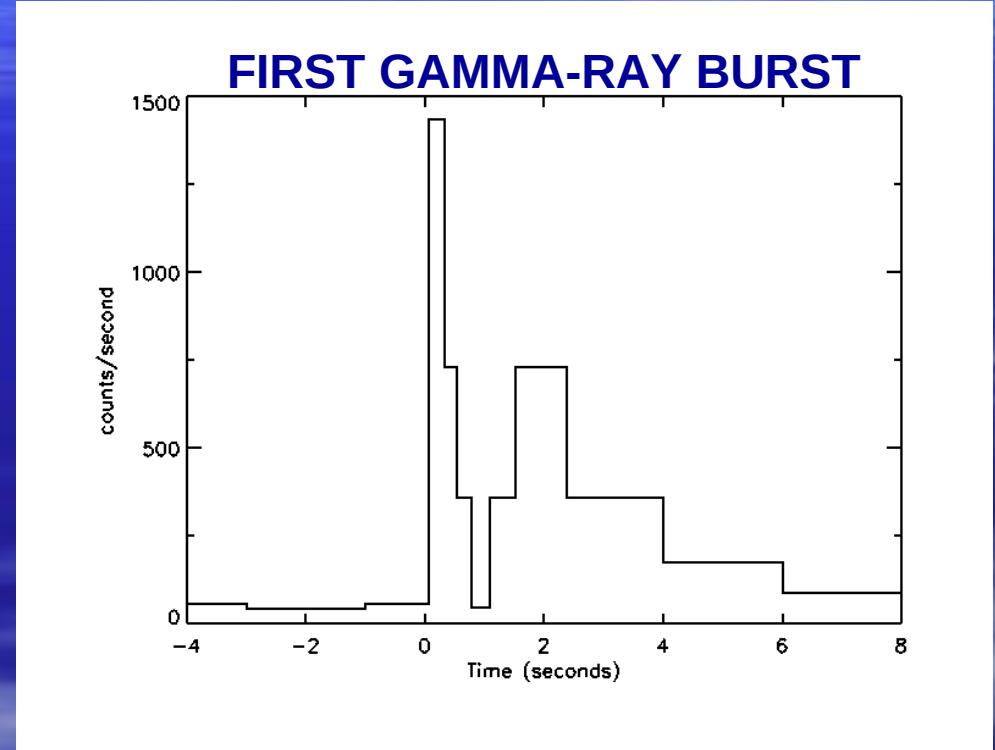

# How to study Gamma rays?

- Absorbed by the Earth's atmosphere
- Use rockets, balloons or satellites
- Can't focus gamma rays
- Special detectors: NaI or CsI crystals, silicon-strips, CdZnTe

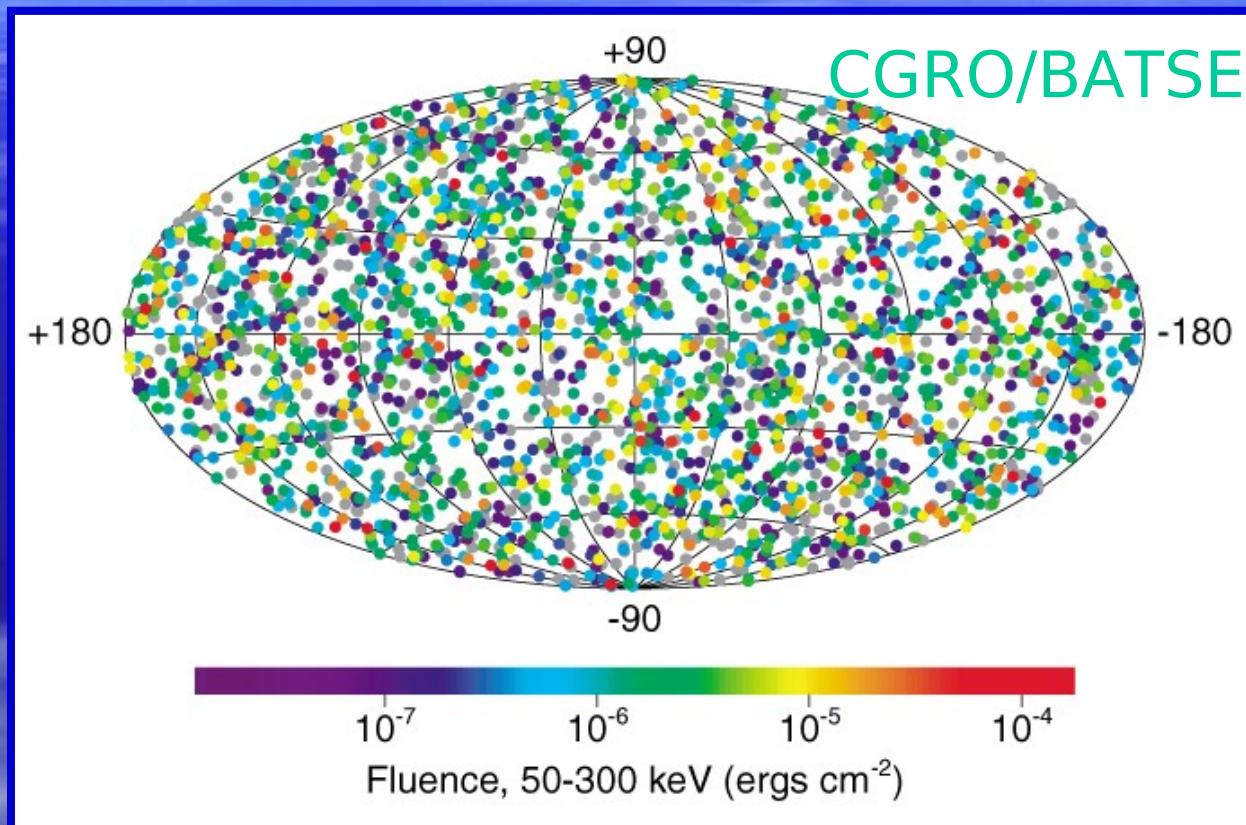

Balloon experiment

# Vela Program (1969-1979)

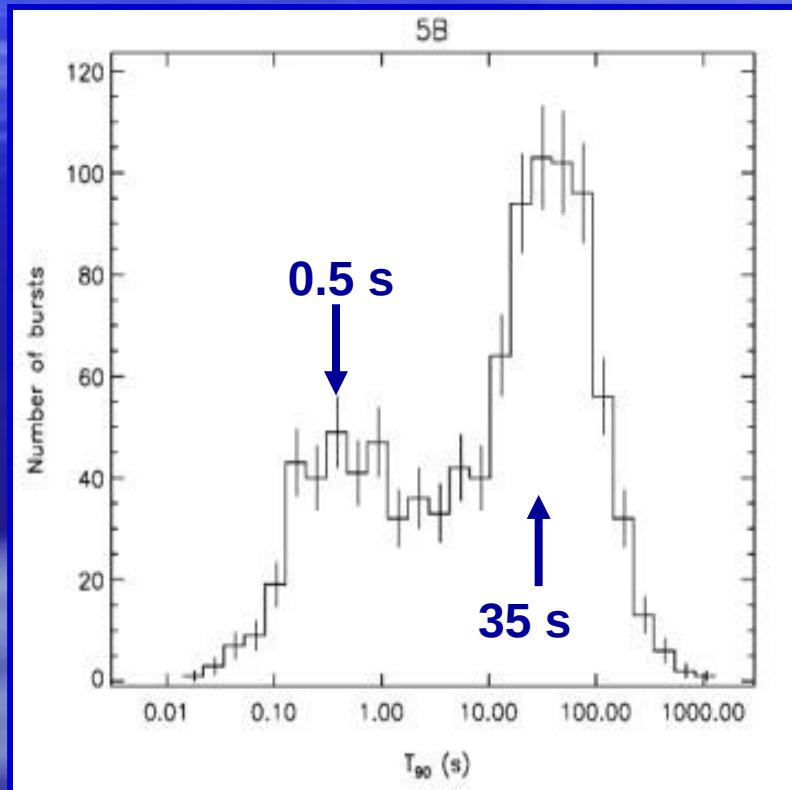

- Discovered in 1971 while looking for nuclear test ban violations

# BATSE Gamma-ray Burst Sky

- 9 years of GRBs – no repeats in location
- Birth cries of black holes?

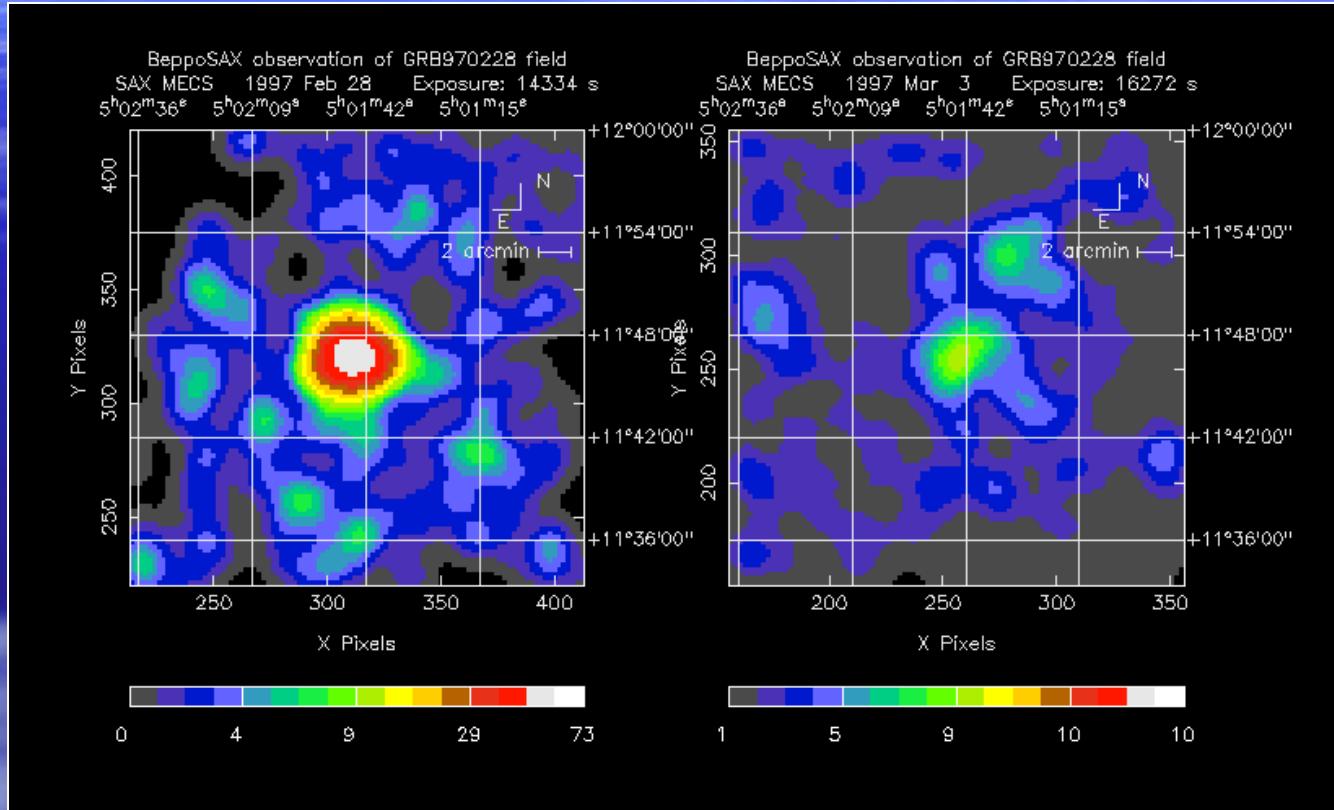

# BATSE GRB Distribution

Briggs et al. 2002

- Shortest burst is 6 ms
- Longest is 2000 s
- Two classes
  - Divide at  $\sim$ 2 seconds
  - Shorter bursts are “harder”
- Only long bursts have “afterglows”

# X-ray Afterglows

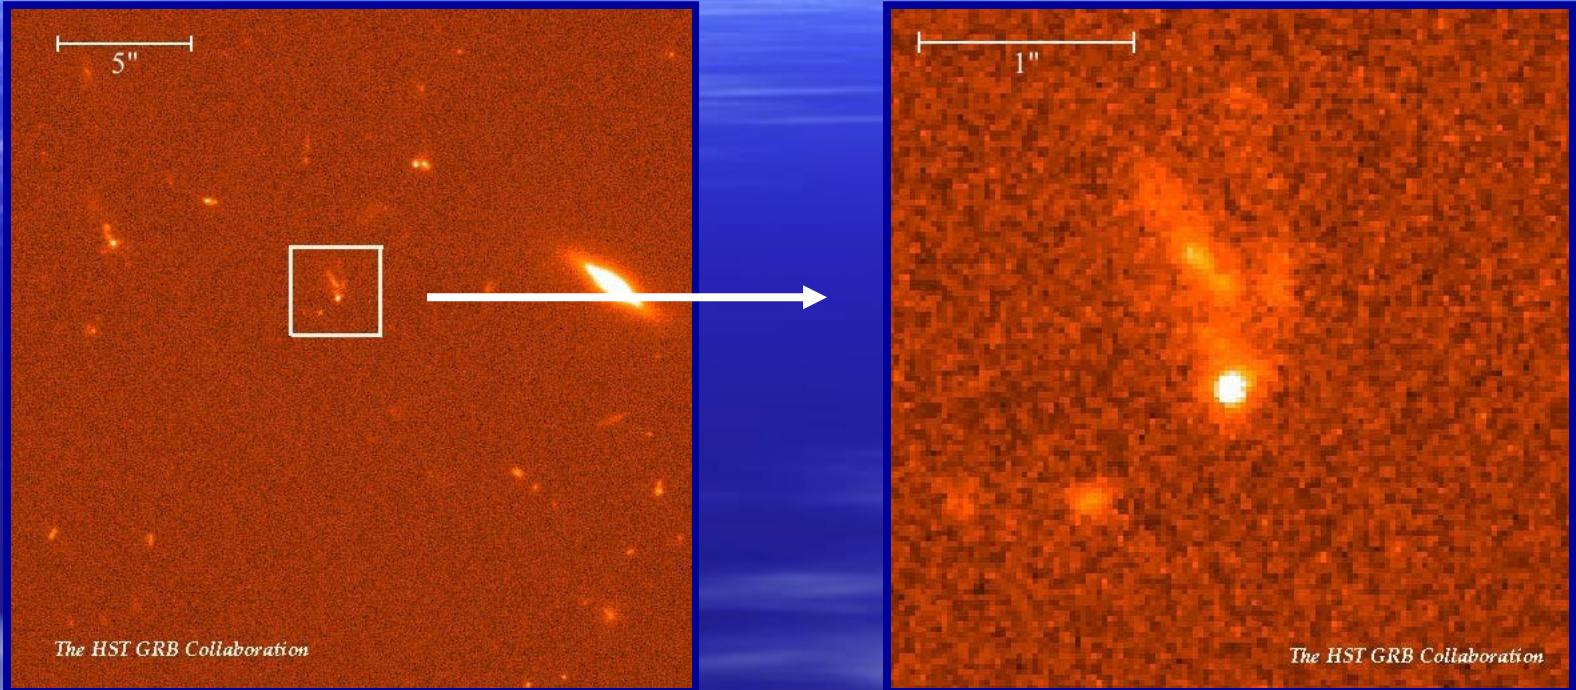

8.5 hours after GRB

5 days later

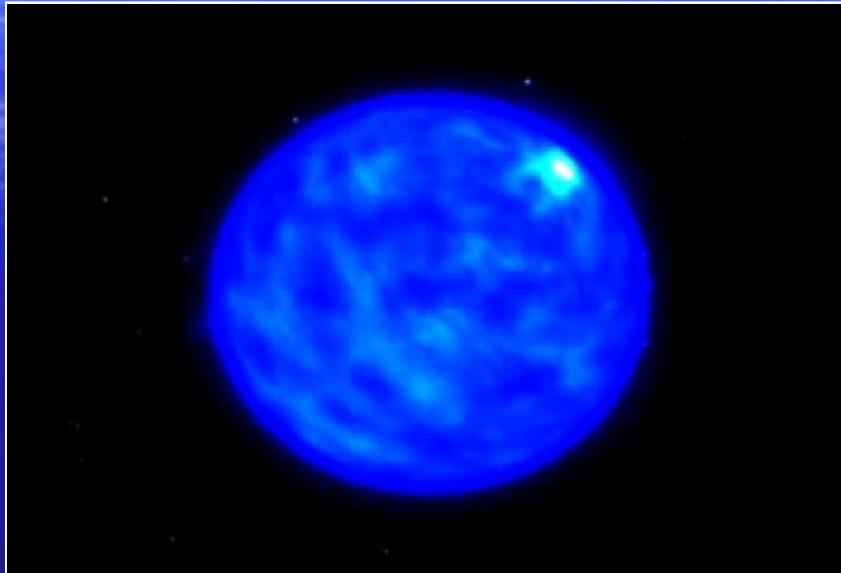

- Discovered in 1997 by BeppoSAX satellite

# Visible Light Afterglows

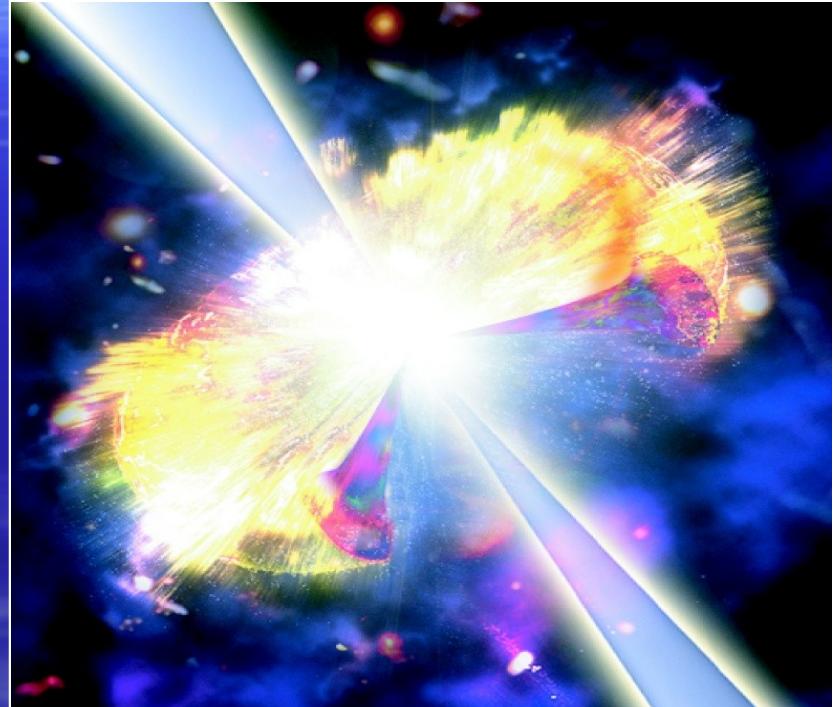

- Fading visible light persists for months
- Redshifts from host galaxies → distances
- Record:  $z = 4.5 \rightarrow 12$  billion light years

# Hypernova

Credit: Dana Berry

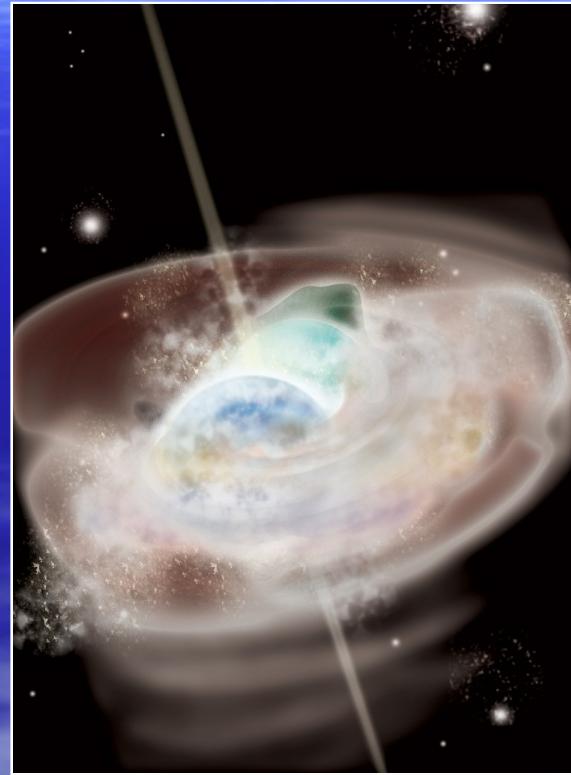

Credit: D. Armbrecht

- Super-supernova – death of star  $\sim 100 M_{\odot}$
- Material remaining after burst  $\rightarrow$  afterglow

# Catastrophic Mergers

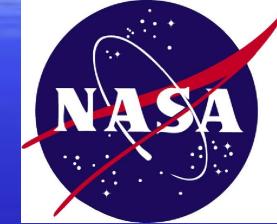

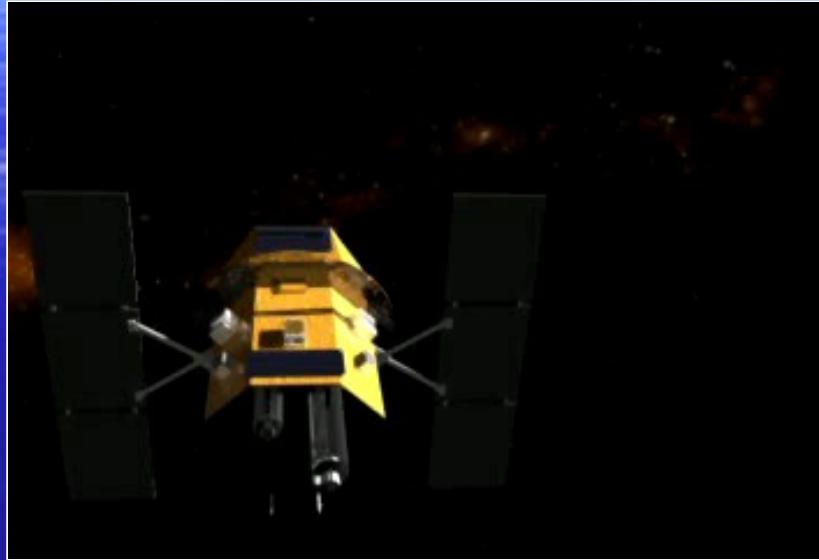

Credit: Dana Berry

Credit: Aurore  
Simonnet

- Death spiral of 2 neutron stars or black holes
- Possible origin of short bursts

# Swift Gamma-ray Burst Mission

- Studies Gamma-Ray Bursts with a *swift* response
- Survey of “hard” X-ray sky
- Nominal 2-year lifetime

# Swift Instruments

- Burst Alert Telescope (BAT)
- Ultraviolet/Optical Telescope (UVOT)
- X-ray Telescope (XRT)
- Autonomous re-pointing, 20 - 70 sec
- Onboard and ground triggers

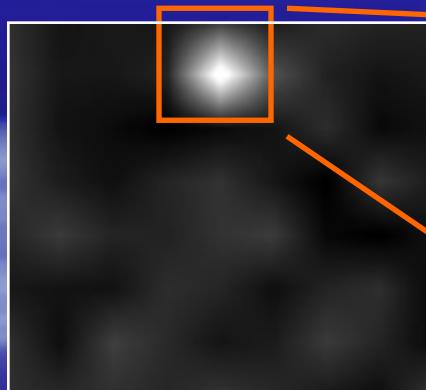

Swift in  
GSFC  
clean room

# Observing Strategy

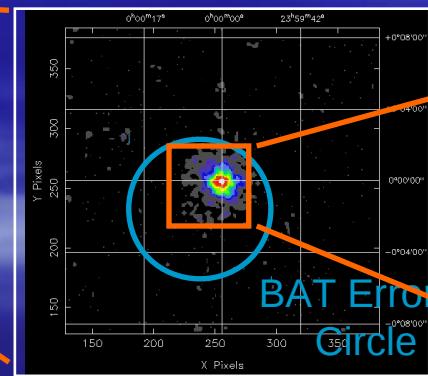

- BAT triggers on GRB, calculates position to < 4 arcmin
- Spacecraft autonomously slews to GRB position in 20-70 s
- XRT determines position to < 5 arcseconds
- UVOT images field, transmits finding chart to ground

BAT Burst Image

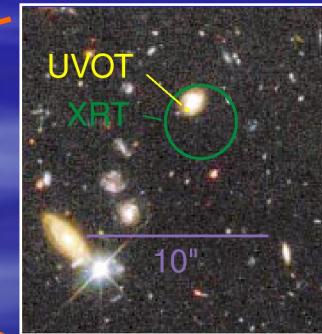

$T < 10$  sec  
 $\theta < 4'$

XRT Image

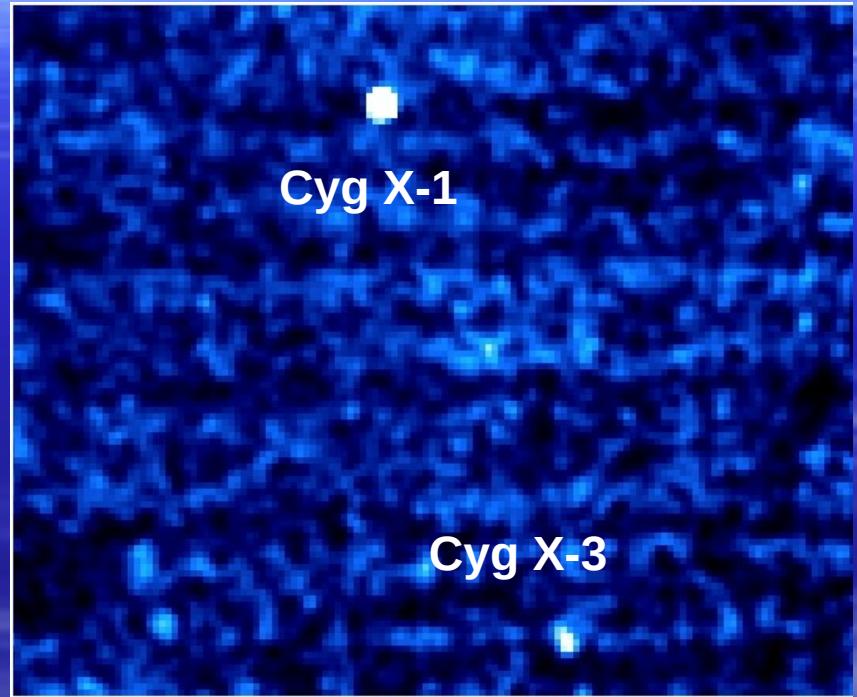

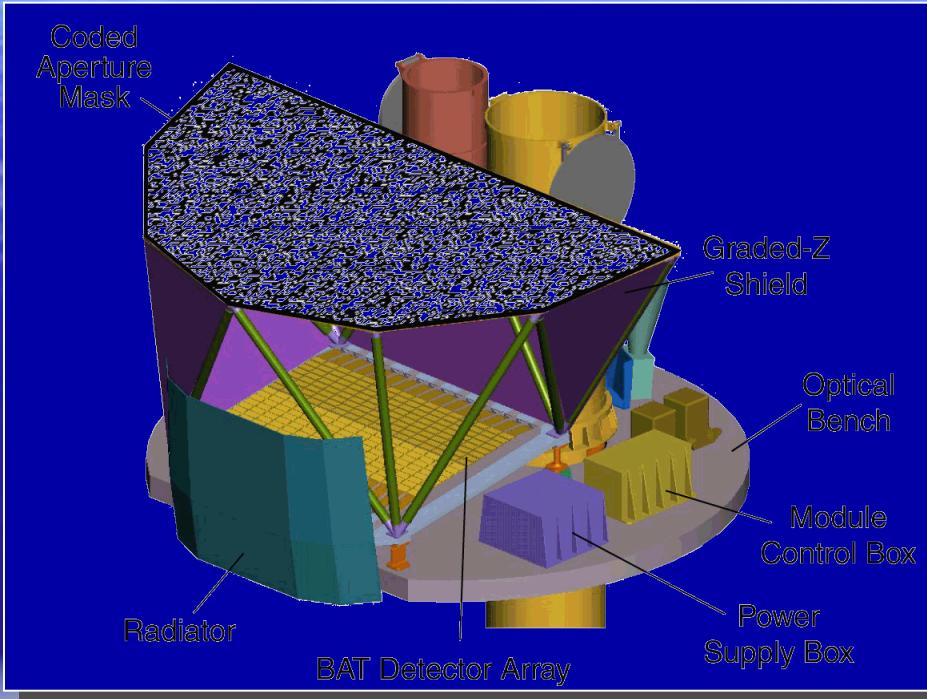

$T < 100$  sec  
 $\theta < 5''$

UVOT Image

$T < 300$  sec

# Burst Alert Telescope

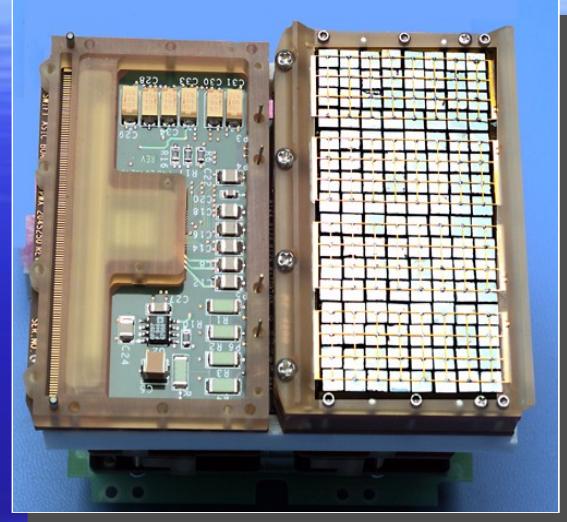

- Detect >100 GRBs per year
- Most sensitive gamma-ray imager ever
- CdZnTe detectors

First light

BAT Structure

CdZnTe detectors

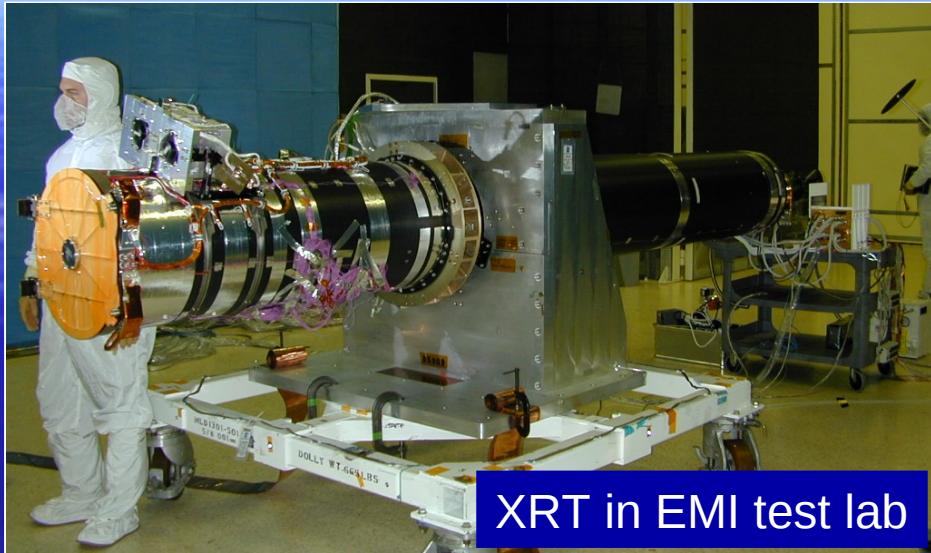

Coded aperture mask

# BAT Specs

## BAT Characteristics

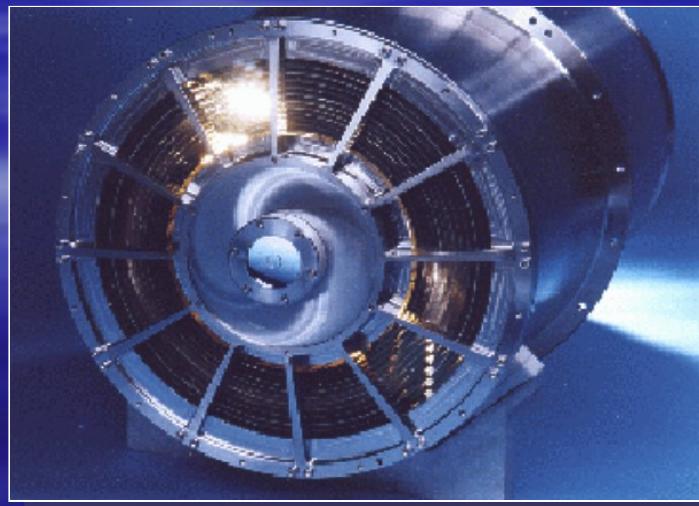

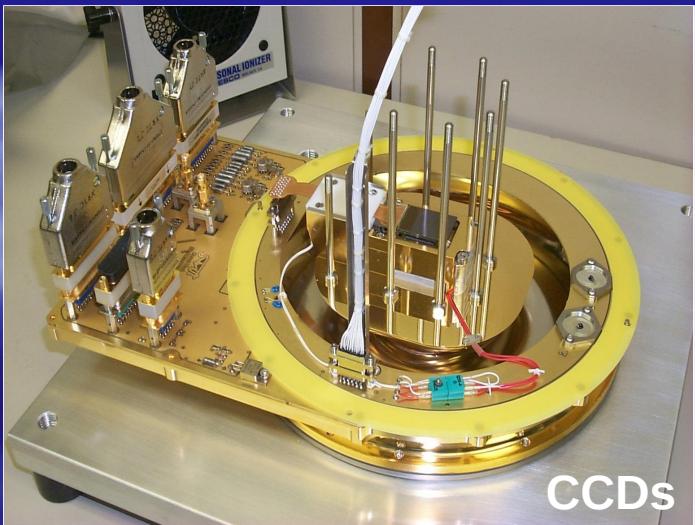

Telescope	Coded Aperture
Telescope PSF	17 arcmin FWHM
Position Accuracy	1-4 arcminutes
Detector	CZT
Detector Format	32768 pixels
Energy Resolution	7 keV FWHM (ave.)
Timing Resolution	100 microseconds
Field of View	2 Steradians, partially-coded
Energy Range	15 – 150 keV
Detector Area	5200 cm <sup>2</sup>
Sensitivity	0.2 photons/cm <sup>2</sup> /s
Max Flux	195,000 cps (entire array)
Operation	Autonomous

# X-Ray Telescope

- Arcsecond positions
- CCD spectroscopy

Grazing incidence mirrors

# X-ray Telescope (XRT)

## XRT Characteristics

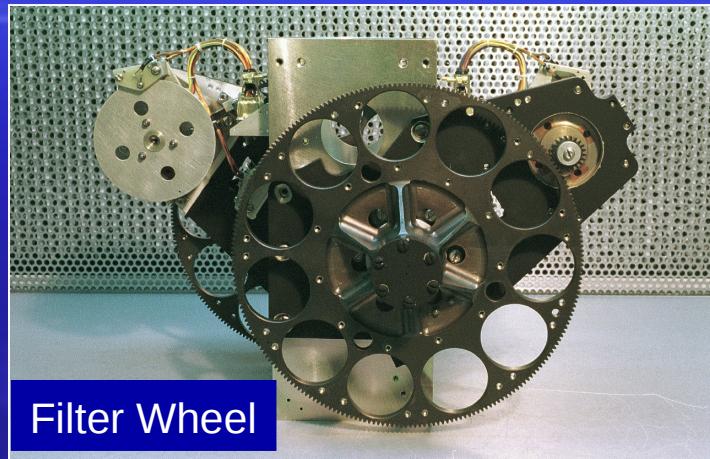

Telescope	3.5 m Wolter I, 12 shells
Telescope PSF	15 arcsec HPD @ 1.5 keV
Position Accuracy	2.5 arcseconds (2 sigma)
Detector	E2V CCD-22
Detector Format	600 x 600 pixels
Energy Resolution	140 eV @ 5.9 keV
Timing Resolution	0.14 / 1.1 milliseconds
Field of View	23.6 x 23.6 arcminutes
Pixel Scale	2.36 arcsec / pixel
Energy Range	0.2 - 10 keV
Effective Area	110 cm <sup>2</sup> @ 1.5 keV
Sensitivity	$2 \times 10^{-14}$ erg cm <sup>-2</sup> s <sup>-1</sup> in $2 \times 10^4$ s
Max Flux	> 45 Crabs (45,000 cps)
Operation	Autonomous

Cas A

First light  
image  
1/5/05

# UV-Optical Telescope

- Arcsec imaging
- Grism spectroscopy
- 24<sup>th</sup> mag sensitivity (1000 sec)
- Finding chart for other observers

# UVOT

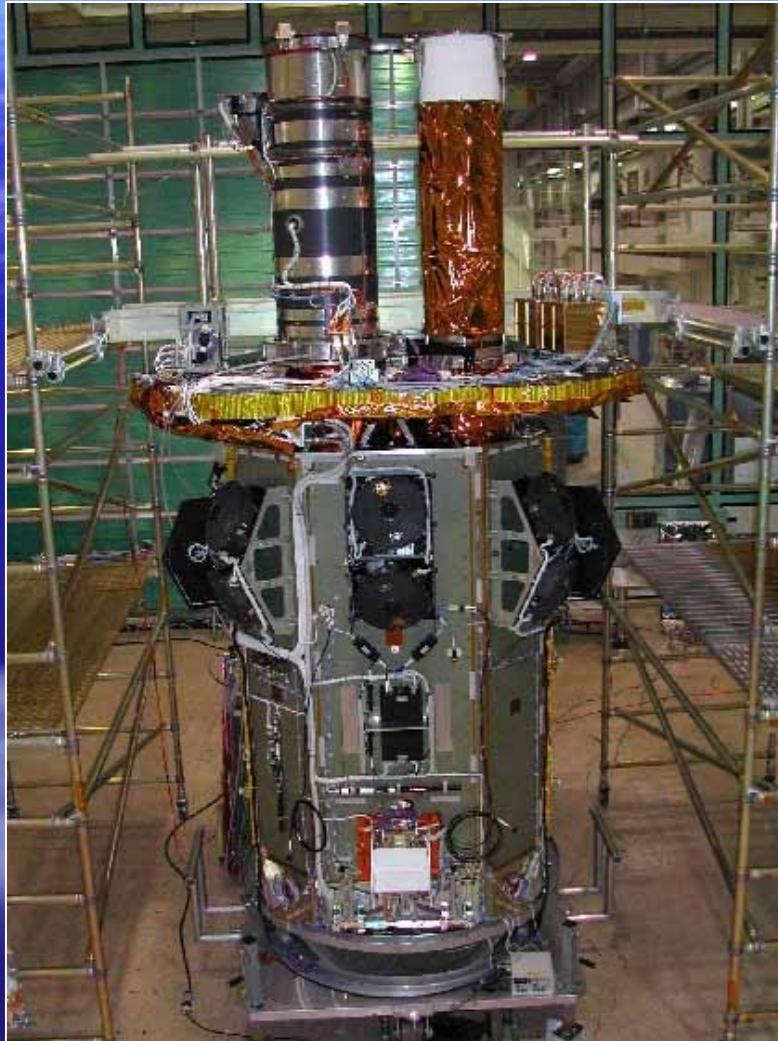

## UVOT Characteristics

Telescope	30 cm Ritchie-Cretien
Telescope PSF	0.9 arcsec FWHM @ 350 nm
Position Accuracy	0.3 arcseconds (2 sigma)
Detector	Microchannel-intensified CCD
Detector Format	2048 x 2048 pixels
Spectral Resolutn	>300 @ 300 nm for $M_v < 17$
Timing Resolution	11 milliseconds
Field of View	17 x 17 arcminutes
Pixel Scale	0.5 arcsec / pixel
Spectral Range	170 – 600 nm
Sensitivity	24th magnitude in 1000 s
Max source	8th magnitude
Operation	Autonomous

# Let's launch anyway!

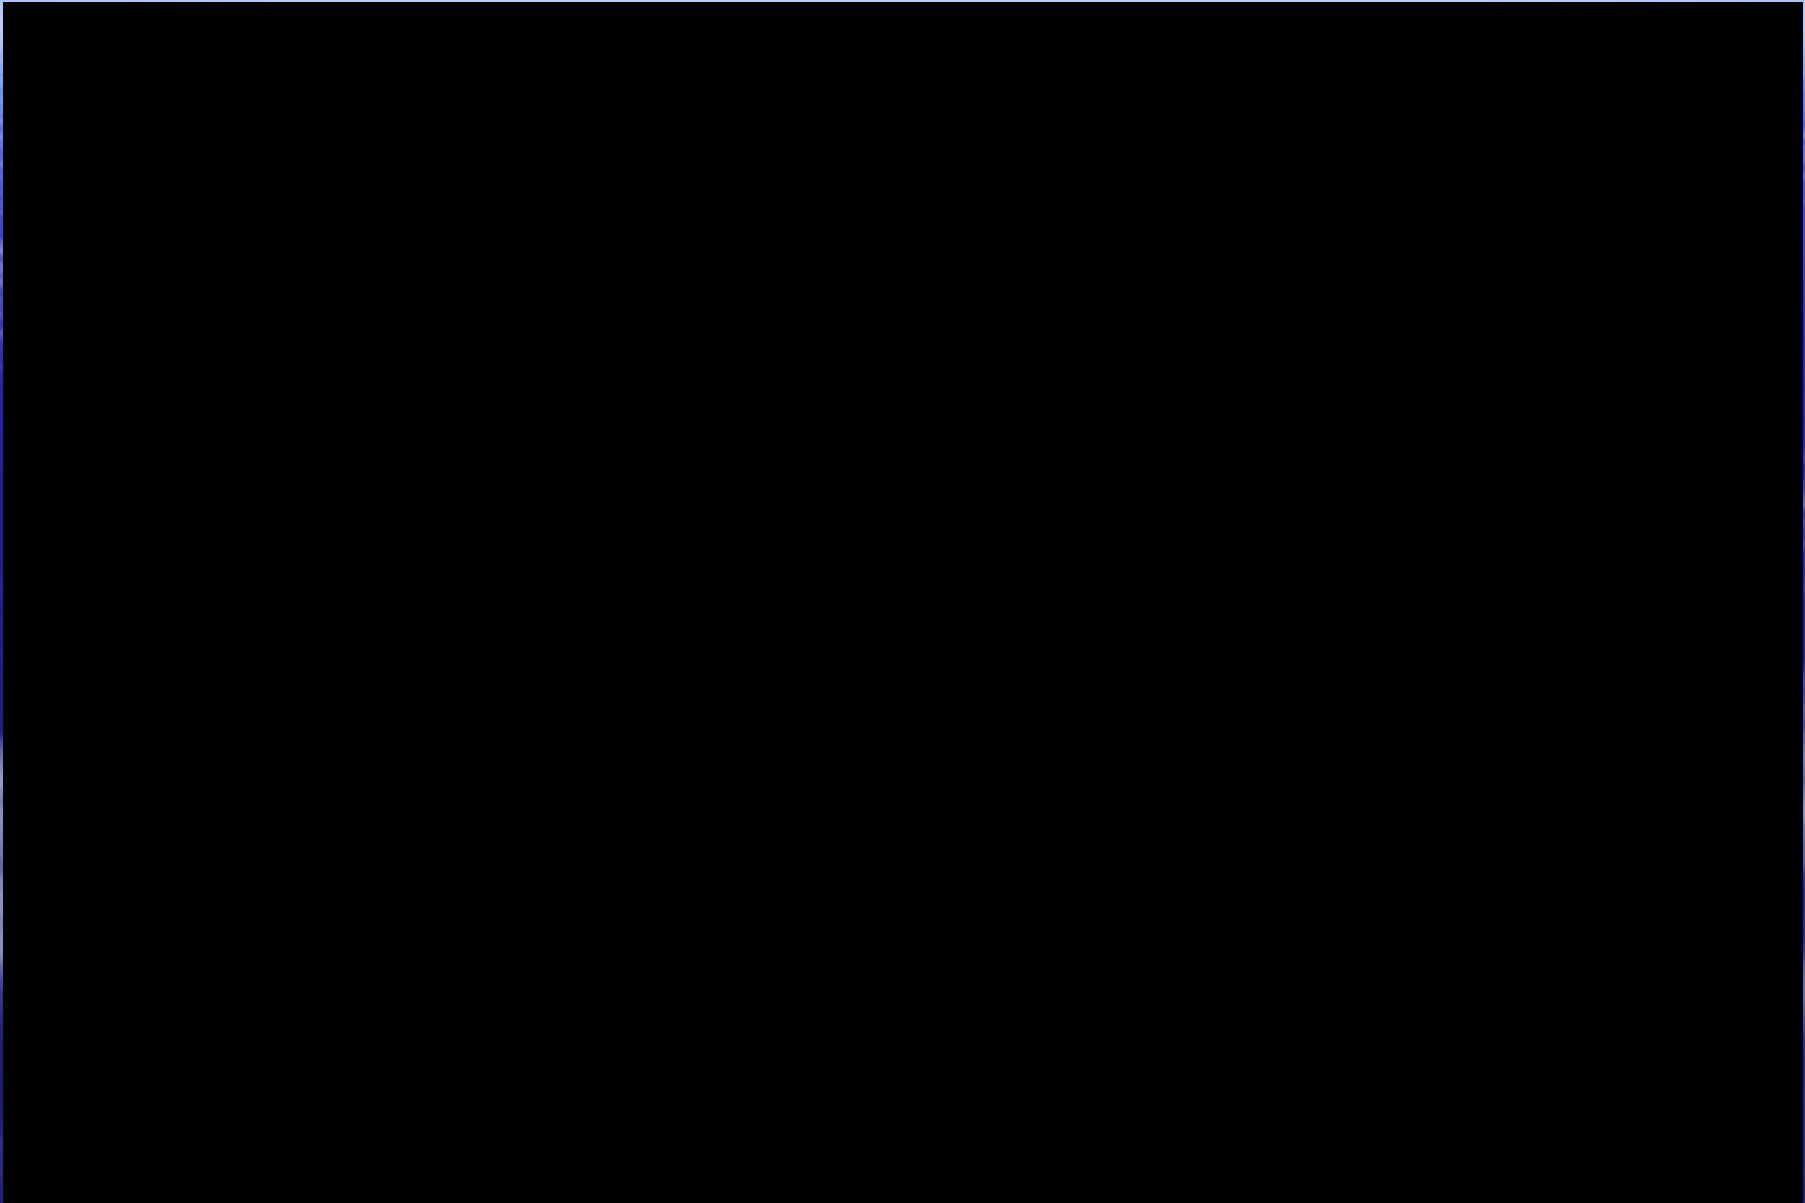

It's just a  
little bit of  
wind...

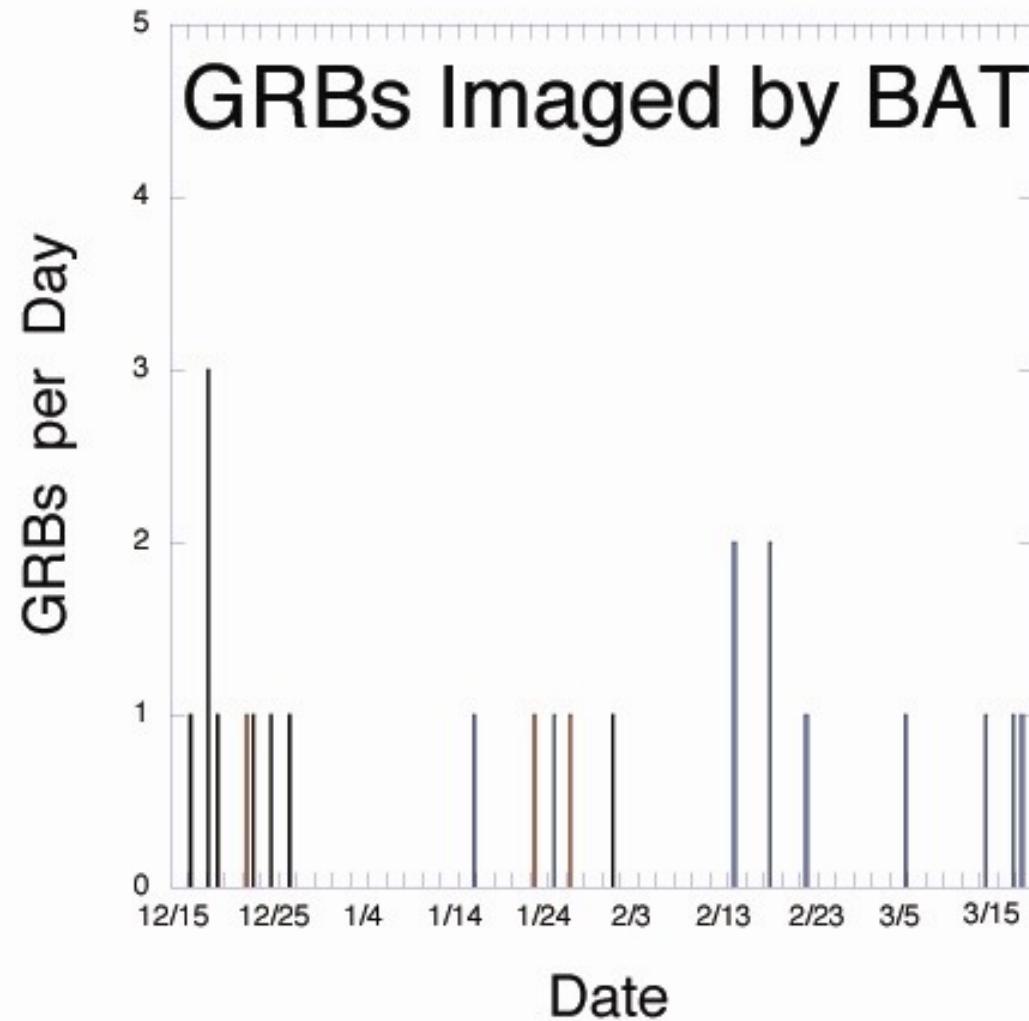

# Swift launch 11/20/04

# Swift launch movie

# Swift burst history

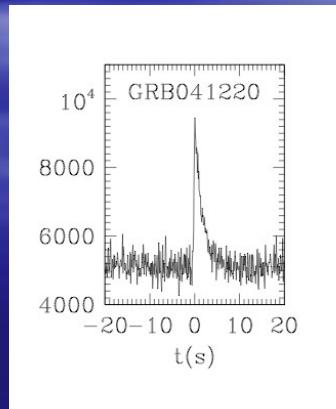

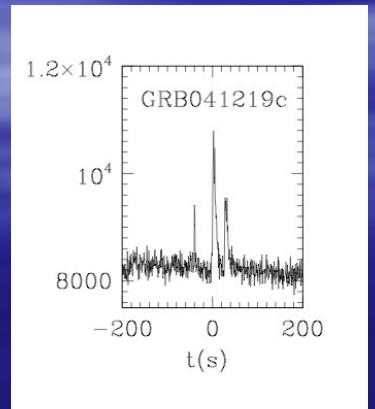

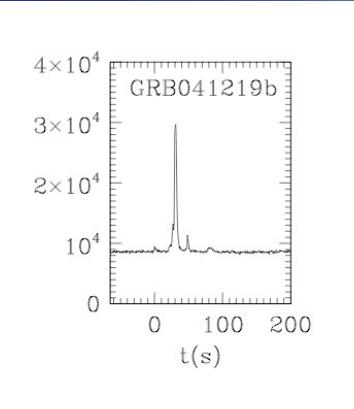

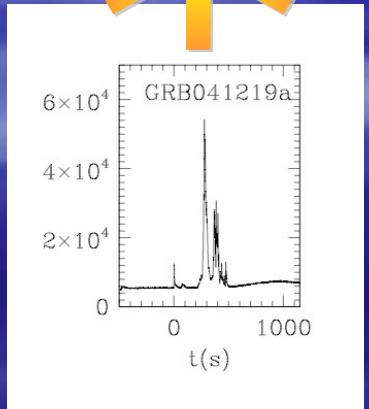

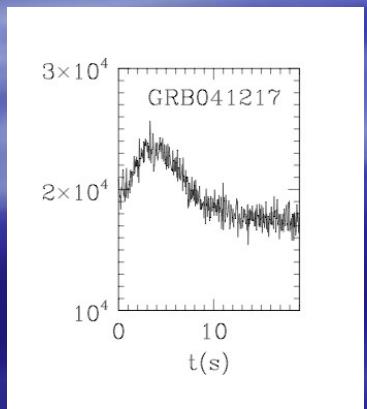

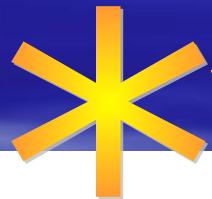

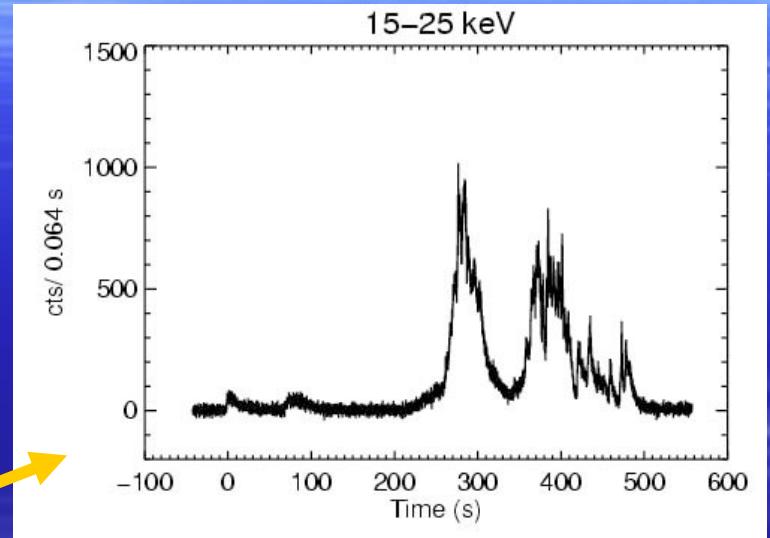

# Swift status in March 2005

- All instruments activated
- BAT detection rate is  $92 \pm 20$  GRBs/yr (cf. 100 predicted)
- Triggers include long GRBs, short GRB, XRF, SGR, XRBS
- BAT background is 12 kHz (cf. 17 kHz predicted)
- Autonomous slewing enabled and working
- Of 23 GRBs imaged by BAT, 9 autonomous slews & 3 ToO slews
- BAT GRB positions good to  $\sim 1$  arcmin
- XRT GRB positions good to  $\sim 2$  arcsec
- UVOT GRB positions good to  $< 1$  arcsec
- Prompt GCN notices now enabled for BAT & XRT
- Swift look direction soon to be a GCN notice
- Observatory will be fully operational by Apr. 5, as promised

# First 5 Swift bursts

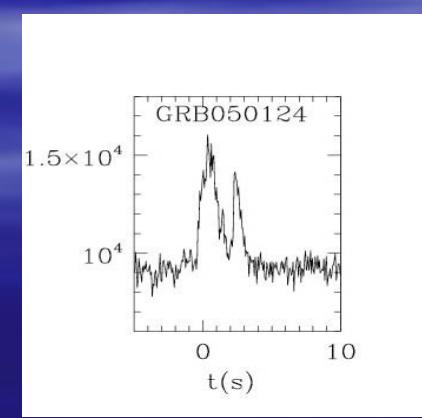

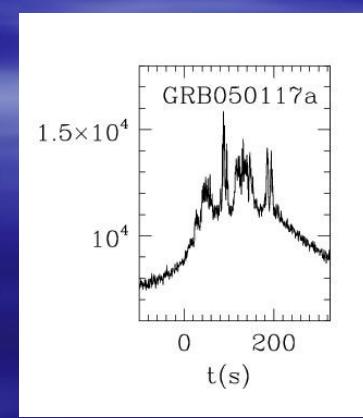

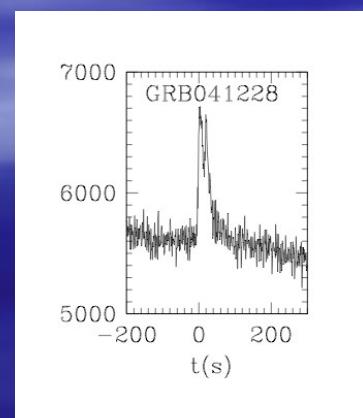

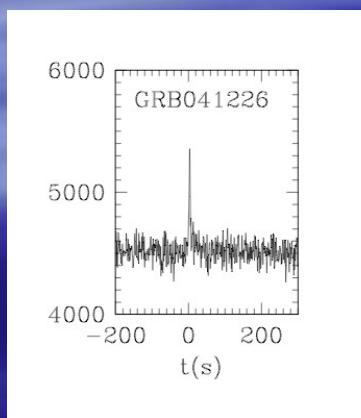

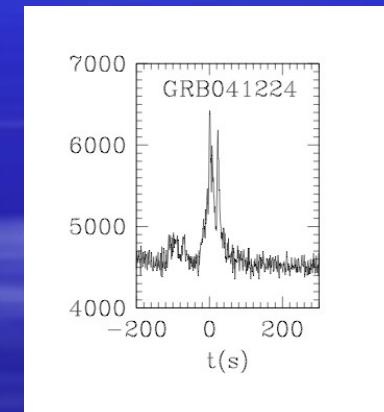

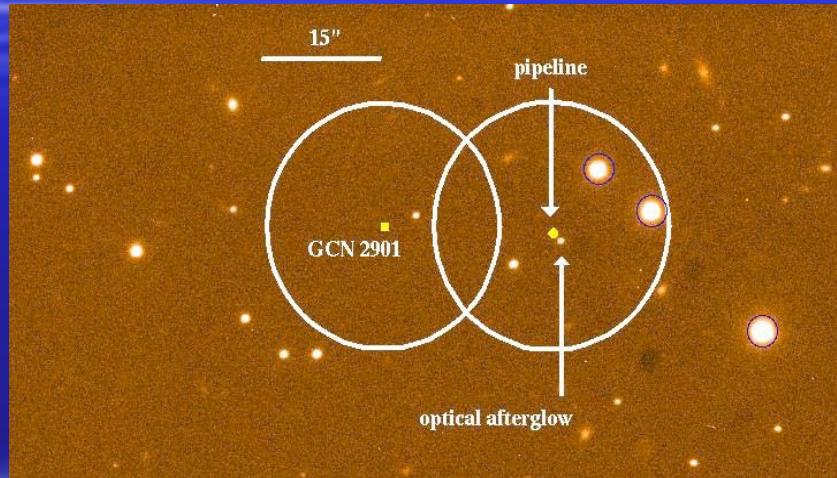

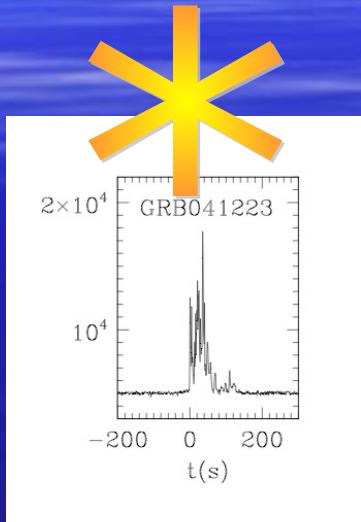

## GRB041219

- fluence in top 1% of all bursts
- duration in top 2% of all bursts
- Optical and IR observations during prompt phase

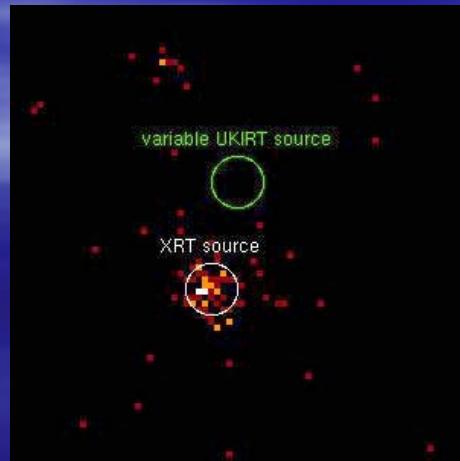

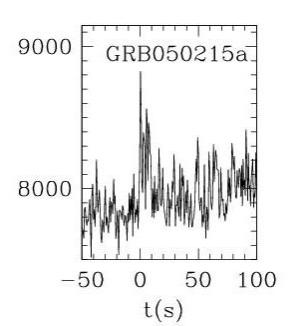

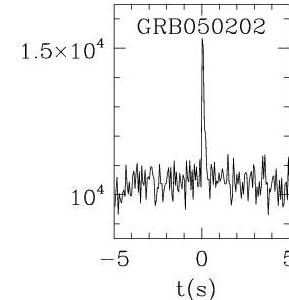

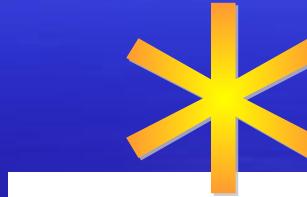

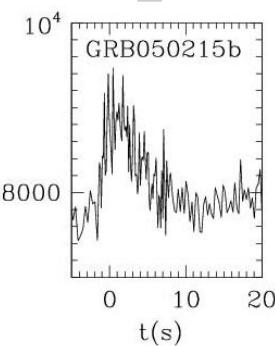

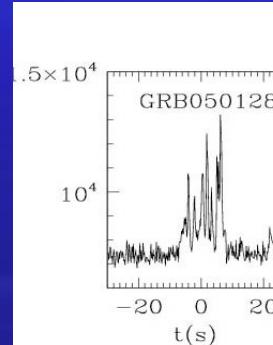

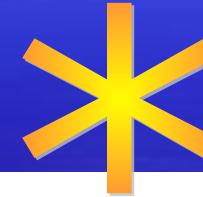

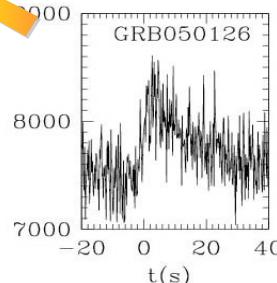

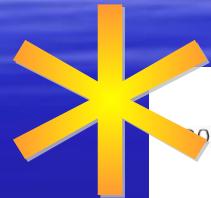

# Next 6 Swift bursts

## ■ GRB041223 – first x-ray afterglow

# Next 5 bursts

- GRB050126 – first redshift  $z=1.29$  (Keck)
- GRB050202 – first short burst – but no slew

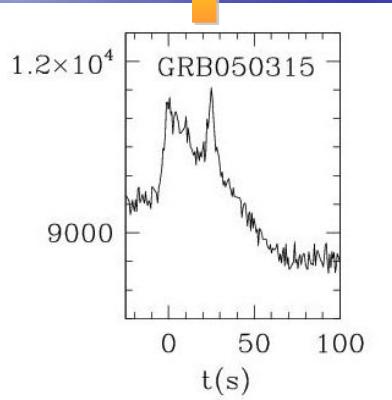

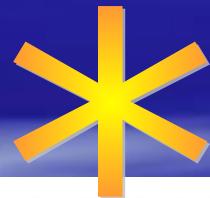

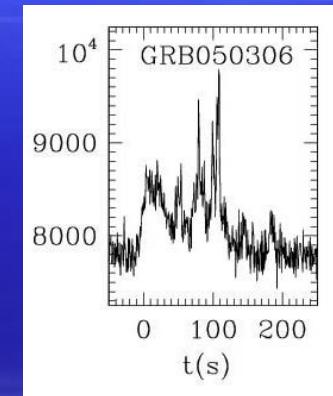

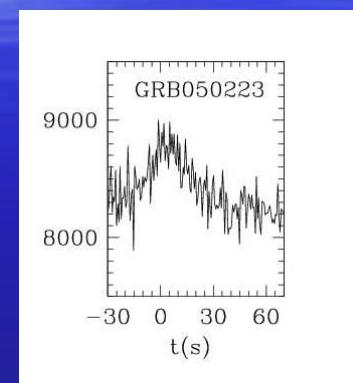

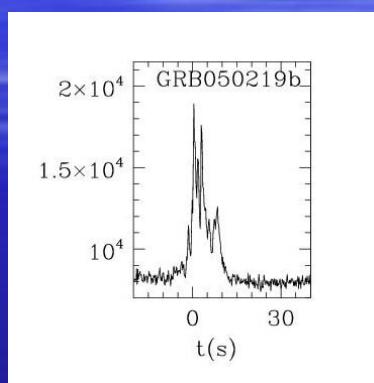

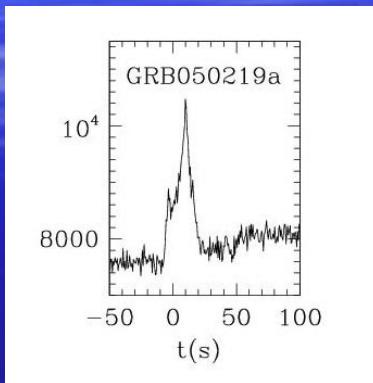

XRF050215b

- Observed by Swift & HETE
- Epeak < 30 keV
- Very weak x-ray afterglow

# Most recent 7 bursts

- GRB050315 – redshift 1.949 (Magellan)

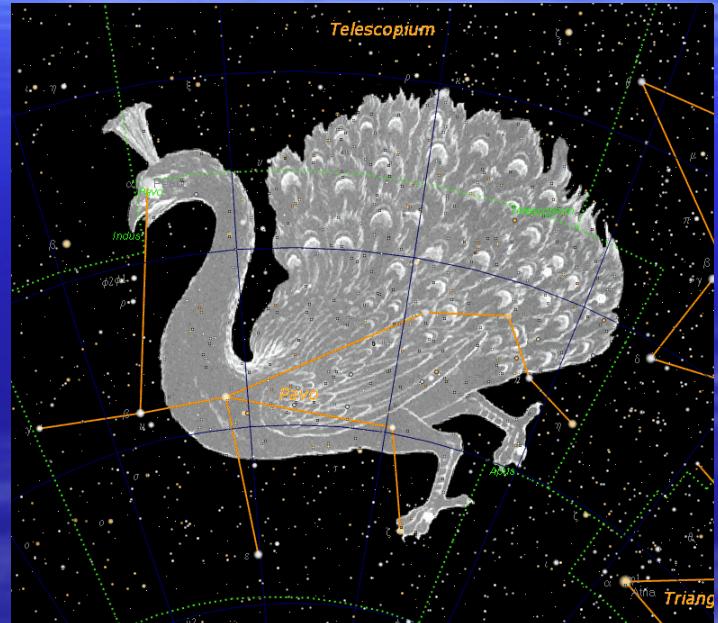

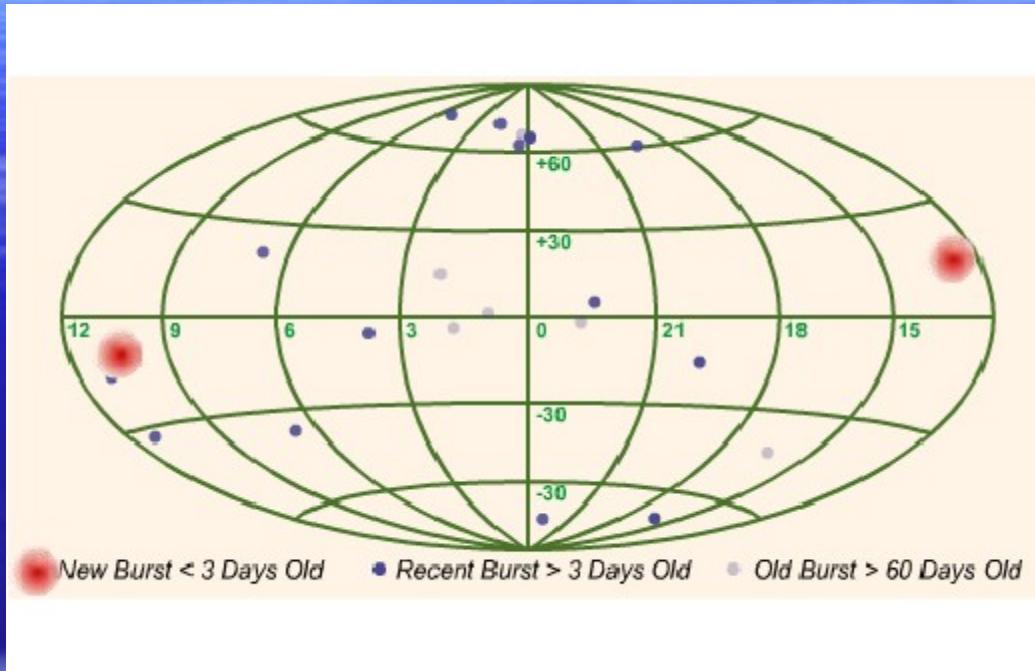

- GRB050318A –RXTE and Swift –Magellan redshift 1.44 – first UVOT afterglow detection!
- GRB050319A –Japanese 14 inch telescope detects afterglow! - ROTSE detects 16<sup>th</sup> mag object 27 s after burst

# Follow Up Network

44 members using telescopes that span the globe

# Fly the Gamma-ray Skies

- Follow GRBs, SGRs, etc. on the Gamma-ray Coordinates Network or the GRB Skymap site
- Join the Global Telescope Network and monitor GRBs and Blazars over the Internet (later talk)
